

ANAMNESIS, ¡LOSS OF SYMPTOMS!

We have lately perceived that once the protocol for data protection is signed, the level of details and symptoms described by the patient and requested by the professional is reduced.

Some of the questions made by the professional are essential for the data collection and for the understanding of the symptoms. Sometimes the patients understand the personal data protection document as the framework to challenge those questions made by the professionals.

When the physical exploration commences, it is then perceived that the patient would not always understand the need to explore areas that are not just limited to the one that the patient considers as the impacted area. This limits the freedom with which the doctor would explore to understand the scope of the symptoms and impact.

These situations brought us to the need of seeking a way to protect the freedom of both professional and patient and to avoid the loss of symptoms that could potentially be related among each other.

Additionally, the anamnesis has extra benefits such as its use for research, training, etc., and scientific evidence.

The valuable information derived from the anamnesis covers a broad range of symptoms both physical and psychological and has to be studied together with other medical tests: echography, magnetic resonance, x-ray, analytical tests, etc. All this could be studied together with similar pathologies if required.

We therefore believe that the Anamnesis already protects the data of the patient whereas it also becomes essential for the continuation of the diagnosis and treatment.

Consequently, we would like to propose that the anamnesis becomes World Heritage according to UNESCO framework.
